14 MVP screens
15 Product principle

01 Product overview

> **Journey Home is a prefunded service platform: users save gradually toward professional photography and videography for a loved one's burial, and Journey Home delivers that service when the time comes.**

Instead of finding and paying for media coverage when a death occurs, a user creates a burial plan for an eligible loved one and makes recurring contributions. When the registered person passes away, the user submits documentation, Journey Home verifies the claim, and operations coordinates the agreed photography and videography.

Core proposition. Save ahead. Prepare with dignity. Capture the memories that matter.
Brand territory. Preparation, dignity, peace of mind, remembrance. The product should not feel like a traditional insurance company or a generic fintech savings app.

02 Problem and goals

Burials happen at short notice, and quality photography and videography is costly and hard to source while a family is grieving and under financial pressure. Journey Home lets families prepare before the event.

Why burial only for the MVP. A burial will eventually happen, so contributions are never refunded for an event that does not occur, and Journey Home avoids behaving like a cash refund insurance product. Other events are a later expansion.

Primary goals

1. Let users create a burial savings and service plan.
2. Let users make recurring payments toward the plan.
3. Let users register the person the plan covers.
4. Let users monitor plan and payment progress.
5. Let users start a service request when the covered person dies.
6. Let admins verify the request.
7. Let admins assign and manage photographers and videographers.
8. Show a clear status throughout the process.

Secondary goals

- Multiple plans under one account
- Payment history and receipts
- Reminders for upcoming payments
- Notifications when a plan status changes
- An architecture that can add other event categories later

03 MVP scope

The MVP covers the full burial plan lifecycle, from signup to completed service, plus a basic admin console. Everything else waits.

Area	In MVP	Not in MVP
Accounts	Registration, login, profile	
Plans	Plan discovery, burial plan creation, multiple plans per user, plan status	Birthday, wedding and childbirth plans; general purpose savings
Covered person	Registration of the covered person per plan	
Payments	Monthly contribution setup, payment processing, recurring payments, payment history	Cash insurance payouts, investment products, loans
Service	Service request, document upload, admin verification, service assignment, status tracking	Marketplace for external photographers, public photographer profiles and booking
Comms	Email and in app notifications	SMS and WhatsApp (later)
Admin	Basic admin dashboard	

04 Users and roles

Three roles matter, and the system must keep the plan owner and the covered person strictly separate.

Role	Who	Account	Responsibilities
Plan owner	Creates and pays for a plan, e.g. Chidi creates a ₦10,000/month plan for his 72 year old father	Yes	Pays contributions, manages plans, starts the service request
Covered person	The person whose eventual burial the plan covers, e.g. Chidi's father	Not required	None in app; details registered by the plan owner
Admin / Operations	Journey Home staff	Yes (admin)	Verify plans and documents, approve or reject requests, coordinate providers, manage fulfilment, users and plans

One plan owner may have many covered people, one per plan.

05 Core user journey

Save gradually › Register a loved one › Event happens › Verify › Journey Home provides the service

1. **Set up.** Create account, explore the burial plan, select a package.
2. **Register.** Add the covered person, choose payment frequency and amount.
3. **Activate.** Make the first payment; the plan becomes active.
4. **Save.** Recurring payments run on schedule; the user tracks progress on the dashboard.
5. **Claim.** When the covered person dies, the user taps *Request Burial Service* and uploads documentation.
6. **Verify.** Operations reviews documents and approves, rejects, or asks for more information.
7. **Fulfil.** Operations assigns a photographer or videographer; the burial is covered.
8. **Close.** Service is marked completed and the plan is closed.

06 Accounts, plans, packages

6.1 Authentication

Users can sign up, log in, log out, reset their password, and verify email or phone where applicable. Signup asks only for full name, email, phone number and password; further profile data is collected after onboarding.

6.2 User dashboard

The dashboard gives an immediate overview of all plans: total active plans, total contributed, next payment amount and date, and per plan its status, covered person and package. Quick actions: **Create New Plan**, **Manage Plan**, **Request Service**.

> **Example card.** Dad's Burial Plan · ₦10,000/month · Active · Next payment Oct 15 · ₦120,000 contributed · 12 payments completed · View Plan

6.3 Burial plan

Each plan has a unique ID and these fields:

`plan_id` `user_id` `covered_person_id` `event_type_id` `package_id` `payment_amount` `payment_frequency` `start_date` `next_payment_date` `total_contributed` `status` `created_at` `updated_at`

Plan status is a controlled enum, never a free string:

`Pending` `Active` `Payment_Due` `Overdue` `Paused` `Service_Request` `Under_Review` `Approved` `Service_Scheduled` `Completed` `Cancelled` `Expired`

6.4 Covered person

Required: full name, date of birth or age, gender, relationship to plan owner, address, phone number (if applicable), and any identification legally required.

6.5 Multiple plans

A user can hold many plans (e.g. Father ₦10,000/month, Mother ₦10,000/month, Wife ₦5,000/month). The data model must be one user to many plans, each plan to one covered person. Do not design around one user, one plan.

6.6 Packages

Packages are configurable by admins, never hardcoded. Indicative tiers:

Package	Photography	Videography	Coverage	Extras
Basic	Yes	No	X hours	
Standard	Yes	Yes	Extended	
Premium	Yes	Yes	Extended	Additional deliverables

Exact contents and pricing must come from the business before development.

07 Payments

> Payments are core to the MVP: every contribution must be recorded against its plan and visible to the user.

7.1 User capabilities

- Make the initial payment
- Make recurring payments
- View payment history and status
- Receive confirmation and receipts
- Update payment method
- See and retry failed payments

7.2 Payment record

`payment_id` `user_id` `plan_id` `amount` `currency`

`payment_reference` `payment_provider` `status`

`payment_date` `payment_method` `created_at`

Status enum:

`Pending` `Successful` `Failed` `Refunded` `Cancelled`

7.3 Recurring payments

The system supports monthly contributions (e.g. ₦10,000 every month). On each cycle it must:

1. Store the recurring payment authorisation.
2. Attempt payment on the scheduled date.
3. Record the transaction.
4. Update the plan (`total_contributed`, `next_payment_date`, status).
5. Notify the user.
6. Retry failed payments per business rules.

Card and account data stay with the payment provider; Journey Home stores only tokens and references.

Open. Payment provider and recurring mechanism must be confirmed before implementation.

08 Service request and fulfilment

8.1 Service request

When the covered person dies, the plan owner taps **Request Burial Service** and provides: plan, covered person, date of death, burial location, expected burial date, contact person, phone number, additional information, and the required documents.

8.2 Documentation

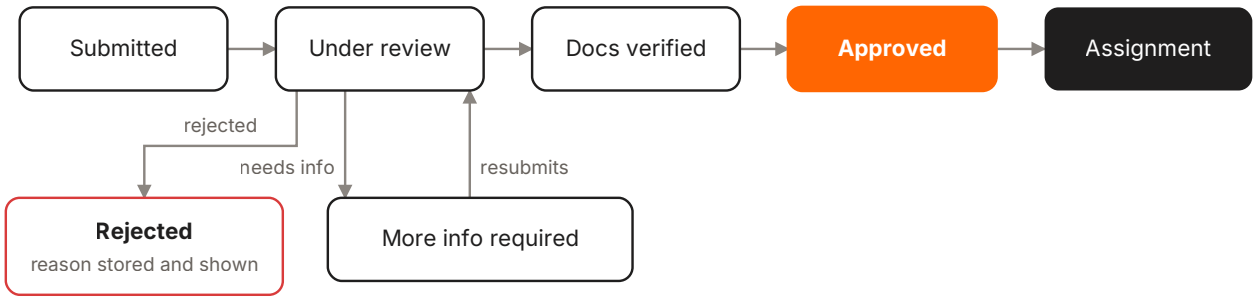

MVP documents may include a death certificate, valid identification, and any other proof Journey Home requires. The business must supply the final, legally required list.

`document_id` `service_request_id` `document_type` `file_url` `verification_status` `uploaded_at` `verified_at`

Files sit in private storage with signed access only. Status enum: `Pending` `Approved` `Rejected` `Requires_Resubmission`

8.3 Verification workflow

Every request is verified before a provider is assigned

Only an approved request reaches provider assignment; resubmissions loop back to review. A rejection reason is always stored and shown to the user.

8.4 Service assignment

After approval, operations assigns providers: photographer, videographer, editor, or other. Admins can assign or change a provider, view provider contact details, set event date and location, and update assignment status.

8.5 Service status

Visible to the user on their dashboard:

`Awaiting_Verification` `Approved` `Awaiting_Assignment` `Assigned` `Scheduled` `In_Progress` `Completed` `Cancelled`

09 Admin console and notifications

9.1 Admin dashboard

The admin dashboard is critical to the MVP; operations runs the service from it.

Area	Metrics shown
Users	Total, new, active
Plans	Active, pending, overdue, completed
Service requests	New, pending verification, approved, upcoming burials, completed
Payments	Successful, failed, total contributions

9.2 Service request detail (admin)

Shows covered person, plan owner, plan, payment status, date of death, burial date and location, documents (death certificate and others) with verification status, service package, assigned photographer and videographer, internal notes, and activity history.

Actions: Approve · Reject (reason required) · Request more information · Assign photographer · Assign videographer · Update service status

9.3 Notifications

MVP channels are email and in app; SMS and WhatsApp come later.

Category	Triggers
Account	Welcome, email or phone verification, password reset
Payments	Successful, failed, upcoming, overdue
Plans	Activated, paused, status changed
Service	Request received, documents approved, documents rejected, request approved, provider assigned, service scheduled, service completed

10 Architecture, security, audit

10.1 Data model

Entity	Belongs to	Key relationships
`users`		Has many `plans`, `notifications`, `payment_methods`
`plans`	`users`	Has one covered person; has many payments and service requests; references `event_types`, `packages`
`covered_people`	`plans`	One per plan
`payments`	`plans`	Many per plan
`service_requests`	`plans`	Has many `documents`, `service_assignments`
`documents`	`service_requests`	Private files, signed access
`service_assignments`	`service_requests`	References `service_providers`
`packages` `event_types` `service_providers` `admins` `audit_logs`		Reference tables managed by admins

10.2 Built for expansion

Do not hardcode "Burial" anywhere. The chain is:

Event Type › **Plan** › **Package** › **Payment** › **Fulfilment**

The MVP enables only `event_type = Burial`; birthday, wedding, childbirth, anniversary, graduation and child milestones can later be switched on without rebuilding the savings system.

10.3 Security and privacy

- Encrypt sensitive data in transit and at rest.
- Role based access control; users access only their own plans; admin permissions are scoped.
- Uploaded documents are never publicly accessible; no death certificates or IDs behind public URLs.
- Card and account data handled by the payment provider wherever possible.
- Validate file uploads (type, size).
- Rate limit authentication endpoints.
- Log important admin actions.

10.4 Audit log

Log every critical action with `actor`, `action`, `resource`, `timestamp`, `metadata`. Examples: plan created, payment successful or failed, document uploaded, admin viewed request, admin approved request, admin rejected document, provider assigned, service marked completed. This record is essential for disputes.

11 Business rules to confirm

These drive backend logic and the financial model, so they must be settled before payment and claims logic is finalised.

- ☐ Who is eligible to be registered as a covered person?
- ☐ Minimum and maximum age of the covered person?
- ☐ Minimum monthly contribution?
- ☐ Available packages and the exact service value of each?
- ☐ Hours or days of photography included per package?
- ☐ Minimum contribution period before a claim (waiting period)?
- ☐ What happens if the covered person dies shortly after subscribing?
- ☐ What happens when payments stop or go overdue?
- ☐ Are refunds ever permitted? What happens on cancellation?
- ☐ Can the covered person on a plan be changed?
- ☐ Final list of required documents?
- ☐ How is fraud detected and handled?
- ☐ What if the burial is outside the service area?
- ☐ How are providers selected and paid?
- ☐ What if Journey Home cannot supply a photographer?
- ☐ What if accumulated payments are below the actual service cost?
- ☐ Regulatory and legal treatment of the product (savings vs insurance)?

12 Success metrics

Stage	Metrics
Acquisition	Registered users, registration completion rate
Conversion	% of users who create a plan, % who make a first payment
Payment	Monthly active plans, payment success and failure rate, average contribution per user
Retention	Recurring payment rate, plan cancellation rate, delinquency rate
Fulfilment	Service requests, verification time, approval to assignment time, service completion rate

13 MVP acceptance criteria

The MVP is ready when:

- ☐ A user can create an account.
- ☐ A user can create a burial plan and register a covered person.
- ☐ A user can make a payment, recorded correctly against the plan.
- ☐ Multiple plans can exist under one account.
- ☐ Users can view payment history.
- ☐ Users can start a service request and upload documents.
- ☐ Admins can review documents and approve or reject requests.
- ☐ Admins can assign service providers.
- ☐ Users can see service request status.
- ☐ Notifications fire for critical events.
- ☐ No user can access another user's data.
- ☐ All critical financial and service actions are logged.

14 MVP screens

User app	Admin console
Landing page	Admin login
Sign up / Login	Dashboard
Onboarding	Users / User details
Dashboard	Plans / Plan details
Explore burial plan / Plan details	Service requests / Request details
Create plan / Register covered person	Document verification
Payment / Payment success	Provider management / Provider assignment
Payment history	Payments / Transactions
Plan progress	Audit logs
Request burial service / Document upload	Settings
Service request status	
Notifications / Profile and settings	

15 Product principle

Journey Home is not just a savings app and not just a photography marketplace. It is a **prefunded service platform**: users prepare financially for a specific future event, and Journey Home fulfils the agreed professional service when it occurs. That distinction should guide the database, payment logic, plan model, service request workflow and admin system.
